Con su larga trayectoria Nescafé es líder en el mercado de bebidas y máquinas de café. Esta marca se destaca por hacer de tu café una obra de arte, pero sobre todo exquisito. Su gran variedad en cuanto a máquinas y sabores la convierten en tu compañera ideal para cualquier ocasión, sea en la oficina, en tu hogar o simplemente compartir un momento delicioso.Una opción para cada gustoArrancar cada mañana de una forma diferente es posible. Con las cápsulas podés elegir entre una amplia gama de variedades de café y otras bebidas, como chocolate caliente. Tap water (normal household potable water) is perfectly OK as long as it is free of odors that might alter the taste of the beverage. Bottled water is also OK.Do not use refrigerated or warm water as this might impact the temperature of the beverage.Use always fresh water and replace the water if system has not been used for more than 2 days.For cold beverages, use water at ambient temperature, never refrigerated water, and place two or more ice cubes (20g per ice cube) in the cup.To be noticed that water hardness is the first reason of machine calcification and so it is recommended to descale the machine frequently (every 3months or less according to water hardness). Could I leave the used capsule in the machine or should I immediately discard it? Once beverage preparation is complete and the power button stopped blinking red (about 5s), remove and discard the capsule. Don't keep it in the capsule holder. Can I put milk in water tank? No, you must not pour the water tank with milk. The system works only with water. The usage of any other liquid, like milk, can be harmful for your machine. How could I make my beverage hotter? The extraction of the Dolce Gusto coffee is made at an optimal temperature, so that it gives a perfect coffee. It cannot be extracted any hotter, as this would cause the coffee grounds to have a burnt taste.If the consumers want a hotter coffee, they have several possibilities: - Preheat the cup. • Ensure that you always wait until the machine stops blinking during preheat of thermoblock before starting a preparation. • Extract some water without capsule, throw the water away and proceed with the capsule afterwards. • Descale the machine if needed (if a decrease of beverage temperature was noticed recently).Normal temperature in cup. • Capsules with roast and ground coffee: above 70 °C • Capsules with soluble products: above 65 °C Can I use the Cold function to prepare hot drinks? No, your preparation will never be hot. In addition, this will not work, as the range of hot beverages is not designed for cold dissolution and cold consumption. It could result in a "blocked capsule". Can I use the Hot function to prepare cold drinks? Cold beverages have been developed to give the best taste and the best experience for consumers when prepared with cold water.However it is possible to prepare these cold beverages with the Hot function. How to use my machine in full safety? To ensure your full safety during the use of your machine, follow the "recommendations for safe use" in the manual that came with your machine.To use your machine safely: • Never put hot water in the water tank! • Never open the locking handle during the preparation of a drink! • At the end of the preparation, the ON/OFF button flashes red for about 5 seconds. Do not open the handle during this time! • Never move the selector lever while the locking handle is open! • Do not touch the capsule after the preparation of the drink! Hot surfaces can cause burns! How do I use my machine for the first time? If you just bought your machine and you use it for the first time, read the manual to help you with the first steps. You can find all machine user manuals online on this website.To help you, here are a few lines the steps for optimal use:1. Fill the water tank of the machine.2. Make sure to snap the water tank in the machine.3. Turn on your machine and wait until the LED is "green".4. It is necessary to purge the machine before its first use. To do this, select on the head the maximum amount of water from the machine, drop an empty container under the head of the machine and press the Cold Water position (blue button) and wait for the end of the stream. Repeat the process on the hot water position (red button). Your machine is then ready for use.5. Fill up your water tank.6. Add a capsule in the capsule holder.7. Choose the appropriate water level (the amount of water is specified on each adapted beverage capsule).8. Select Hot/Cold water depending on your drink.9. Then wait until the LED is "green" to remove your capsule safely.10. Throw your capsule away. How long do I need to wait before preparing another drink? You just need to make sure the indicator light is green in order to prepare another drink. Maintenance and cleaning What is the best way to descale or clean my espresso machine? Follow the instructions in your personal instruction manual for descaling your machine as techniques vary according to the model you own.We recommend using the descaling product provided by the manufacturer. For a daily average usage of 4 cups - Take out the machine and select the large cup. - Fill the tank to the maximum with hot water (60°C). - Turn on the machine and select the large cup. - Take out and reposition the tank every 3 seconds. There should be air bubbles escaping from the tank valve. - The priming is done and the water flows through the coffee outlet.If priming is not possible after these manipulations, take the appliance to an authorized service center. What should I do if my appliance is not working? After following the instructions in the user manual for starting the appliance, make sure that your electrical socket is working by plugging another appliance. If it still does not work, do not try to dismantle or repair the appliance yourself, instead, take it to an approved repair centre What should I do if the power cord of my appliance is damaged? Do not use your appliance. To avoid any danger, have it replaced by an approved repair centre. Why is the power button orange? When the power button is orange instead of green, it means that the descaling warning has been triggered. This feature is available on models produced since 2014.Each time the consumer touches the Hot or Cold button, it is considered as an extraction. Descaling warning is based on the number of extractions and it is triggered every 300 extractions by a orange lighting of the ON/OFF button. Machine still works but we recommend to descale it.Switch off the machine, press the power button for 5s until the power button starts blinking and the descaling mode is activated. Machine can be descaled according to the user manual available in the machine care page.To be noticed that if the descaling mode is activated and the machine is switched off without doing the descaling, the power button will turn back to green and the counter is reset. After 300 new extractions, power button will again turn to orange. Why the needle is removable and how can I remove it? If the machine is not descaled on a regular basis and consumers use hard water (highly charged in calcium carbonate), the machine becomes scaly and the needle is likely clogged.On new models, the needle can actually be removed and the main purpose is to allow consumers to clean the needle specially when it is clogged or the flow starts to decrease. This cleaning must be followed by a full descaling of the machine. There is no flow, what should I do? If the machine has no power or if the machine can be switched-on but the pump does not start when selecting the Hot/Cold button (no noise), there is nothing that you can do and the machine must be repaired.If you hear the pump but there is no flow, follow the different steps:1-Remove the capsule from capsule holder.2-Check that there is water in water tank and that water tank is well plugged.3-Select the cold channel, lift and put down the water tank several times and then fix it, flow should start. If not, the needle is probably clogged. The needle must be cleaned with the cleaning tool provided with the machine and machine must be descaled. If your machine is equipped with a removable needle (part in green), you can remove it to clean it deeply.If after this, there is still no flow, machine must be sent to a repair centre. Why does the capsule holder leak on the side? The reason why the capsule holder leaks on the side is probably due to the fact that the connection between the needle and the water tube is not perfectly tight any more.The machine need to be repaired. Why do I sometimes get different foam levels/amount of beverage even though I always press on the same number of bars? The amount of beverage depends on the size of the cup, the position of the drip tray, and sometimes the milk and coffee powders which are natural products that might show a small seasonality effect. Water or liquid is leaking outside the machine during beverage preparation. It is important to assess where this leakage is coming from (water tank, capsule holder or underneath the machine).You can check whether it is from the water tank by pouring the water tank with water and keeping it on a table for a while (at least 30 mn). if it does not leak, it means that it is more related to the tightness of a water tube and in this case we recommend you to contact our consumer services center. I can't take out my capsule holder, what should I do? Before taking out the capsule holder, make sure the selection lever is in the middle position and locking handle is lifted up.If the locking handle is up but capsule holder can't be removed, that means that the needle plate is probably not held in place properly and is in a wrong position. Please contact our consumer services center. If the locking handle can't be lifted up at end of extraction, please do not force it. The capsule might be under pressure. Wait for 20 minutes to release the pressure, lift up the locking handle, remove capsule holder and throw away the capsule. if it does not work, please contact our consumer services center. During beverage preparation, coffee/milk is splashing out of the cup. Adjust the cup support to the correct level in order to not be too far or too close to the beverage outlet. Use another cup size. The beverage is coming out at an angle and not straight into the cup. The quality of the final beverage is not impacted and can be consumed. Before preparing the next cup, clean and dry the capsule holder, particularly the beverage outlet opening. Once I finish beverage preparation and stop the machine, there is still continuous dripping of product into the cup. This is normal: as long as the capsule is not removed and discarded, it will continue to drip into the cup or the drip tray (once the cup is removed). The dripping lasts longer for coffee capsules than for creamer capsules. To stop dripping, remove and discard the used capsule after the light stops blinking. Upon removal of the capsule holder and the capsule from the machine, some water/product drops are coming out from the top of the injector capsule. It is likely that you have removed the holder from the machine too soon or has extracted a lower volume than recommended, causing this backflow. Always wait for the light to stop blinking before opening the machine. Some drops of product are dripping out of the capsule holder as I remove the holder from the machine. Normally, there should be no drops out of the capsule during removal from the machine and discarding. In order to minimize the risk of dripping on counter surfaces, a dedicated bin is provided with each machine purchase (except for Piccolo) and should be kept near the machine. Water/product is dripping out of the capsule after I discarded it in the bin. Once the beverage is delivered to the desired strength/volume, any remaining water (and some product traces) remains in the capsule in order to not dilute the taste of the beverage. Some of this remaining liquid might drip out of the capsule in the bin. The specially designed bin provided with the machine (except for Piccolo) allows for easy separation of liquid and solid waste (refer to the manual). Clean the bin regularly. During beverage preparation, the flow is too fast or too slow. Some products (e.g. coffee capsules) are designed to flow slower than others (e.g. creamer capsules) in order to achieve the desired cup quality. If flow is slower than normal, unblock the needle and descale the machine following the User Manual instructions. What do the different LEDs in the machine mean? • When you start your machine and during the rise in water temperature, the on/off button flashes red for about 30 seconds. • When the machine is ready, the on/off button turns green. • At the end of the preparation of the drink, the on/off button flashes red for about 5 seconds. Do not remove the capsule holder during this time! • Eco Mode: after 5 minutes of non-use, the machine switches off automatically. • If the on/off button flashes red/green, it means that machine has detected a lack of water. Check that the capsule is not blocked and that there is enough water in the tank before starting a new preparation. • If the on/off button turns orange/yellow continuously (descaling warning), you should descale the machine.For more details about the LEDs on your machine, please refer to the user manual of the machine. Can I use a machine in countries with different voltages? No, you can only use safely machines from countries with the same voltage. In the case the voltage is higher than the one where the machine was bought, it won't work or the fuses will burn. In case the voltage is lower then it's possible that the machine won't work. Various topics What makes an authentic Espresso Coffee? The sign of a true Espresso is the froth which is created by pressure within the machine whilst the coffee is being made. The pressure is measured in bars (from 1.5 to 19) so the higher the bar pressure the richer and thicker the froth. How does an espresso compare to filtered coffee? An expresso has a stronger aroma than a "normal" coffee.In fact, an expresso can be distinguished by its rich aroma and the creamy foam on the surface of the cup.This requires a pressure of 15 bar (achieved only by espresso machines), water heated to 90-92°C and finely ground and measured coffee (7 g per cup). Where can I dispose of my appliance at the end of its life span? Your appliance contains valuable materials which can be recovered or recycled. Leave it at a local civic waste collection point. I've just opened my new device and I think there is a part missing. What should I do? If you believe that one part is missing, please call Consumer Services Center and we will help you find a suitable solution. Where can I buy accessories, consumables or spare parts for my appliance? Please go to the "Accessories" section of the website to easily find whatever you need for your product. What are the warranty conditions of my appliance? Find more detailed information in the Warranty section of the website. I've heard that the machine is equipped with an aluminum thermoblock, coated with stainless steel. Does this mean that the hot water will only be in contact with the stainless steel but not with the aluminum? I'm worried, as the aluminum in the water is bad for health. The aluminum in the thermoblock is not in contact with water, it is only there for heat transfer purposes. The water pipes are made of stainless steel. Is it recommended to use the machine as a water boiler? The machine is not supposed to be used as a water boiler. Without capsule the flow is higher, the heat transfer is lower and the temperature will probably not reach the expectation of consumers. Are there any other safety precautions I should take? I have small children and I am concerned about their safety. We do not recommend the appliance to be used by children. This information is clearly stated in the User manual. What is the maximum of beverages a machine can make per day? There is no limit in the number of coffees a machine can make in a day, but consumers need to be careful not to make too many coffees in a row, because if they are continuously extracting beverages it might lead to an over-heating of specific elements of the machine resulting in error mode triggering.What we can advise is that consumers can make 5-6 coffees in a row, but then they need to wait for a moment (1-2 minutes should be enough) before resuming extracting. Can I change the color of the red wire of NESCAFÉ Dolce Gusto® machine? Each NESCAFÉ Dolce Gusto® machine has a protective red wire which can't be changed.It ensures the safety of consumers that is so important to the brand of Modern Art Café: NESCAFÉ Dolce Gusto®. What is the difference between a manual and an automatic machine? There are 2 different types of machines:In the case of a manual machine, you are the one controlling the amount of water suitable for your drink. The machine does not stop by itself and stops when you move the selection lever back to the middle position.In the case of an automatic machine, you choose in advance the amount of water that will be delivered. The machine will stop by itself automatically. How does the system work? The NESCAFÉ Dolce Gusto machine heats water, which is passed at high pressure - a maximum of 15 bars - through a capsule of high quality roast and ground or soluble products (milk, chocolate, etc...) depending on the capsule variety.The coffee that is used in the capsules is made mainly of premium Arabica varieties.The capsules are designed to deliver an even distribution of water and pressure over the coffee to ensure that flavour is maximized. This system uses pressure similar to that of professional machines.Whilst coffee percolators operate at one bar of pressure (normal atmospheric pressure) and a number of other machines operate at no more than two bars, the NESCAFÉ Dolce Gusto system can operate up to 15 bars. Does the machine have a shelf life? No, the machine is not a perishable item and can be used as long as it works properly. Is the plastic hose used inside PE (Polyethylene)? PP (Polypropylene)? Nescafé Dolce Gusto machines are carefully developed and manufactured in order to ensure the safety of our consumers and the delivery of the best in-cup beverage experience. The choice of component materials is carefully selected based on safety, durability, cleanliness and cost effectiveness. Before release for sale, all our machines are passed through stringent tests to ensure that the machine meets all safety requirements for food contact materials in all selling markets. We can therefore assure you that any Nescafé Dolce Gusto beverage, prepared with a Nescafé Dolce Gusto Machine, is compliant, safe for consumption and aligned with the preferences expressed by our consumers during our consumer research studies. What is the grade of the stainless used in the machine. 304? 316? Nescafé Dolce Gusto machines are carefully developed and manufactured in order to ensure the safety of our consumers and the delivery of the best in-cup beverage experience. The choice of component materials is carefully selected based on safety, durability, cleanliness and cost effectiveness. Before release for sale, all our machines are passed through stringent tests to ensure that the machine meets all safety requirements for food contact materials in all selling markets.
